

# Sound attenuation

## Closed circuit cooling towers

### Options and accessories

#### Sound attenuation

VXI closed circuit cooling towers use **quiet centrifugal fans**, but to reduce noise even further, you can extend your VXI cooler with sound attenuators at the air intake and discharge points.

#### For suburban areas:

##### Light sound attenuation ([XA type](#))

- Discharge attenuator with vertical baffles
- Intake attenuator with angled baffles

#### For residential areas:

##### Medium sound attenuation ([XB type](#))

- Discharge attenuator with vertical baffles
- Intake attenuator with straight baffles

## For rural areas:

### Heavy sound attenuation ([XC type](#))

- Double discharge attenuator with vertical baffles
- Double intake attenuator with straight baffles

Your [local BAC representative](#) can explain any of the above sound attenuator options in more detail and provide you with [sound pressure and sound power data](#).
